Decision-making process

Define the problem

Determine requirements

Establish objectives

Identify alternatives

Define criteria

Select a decision making tool

Evaluate alternatives

Validate solutions

Decision Support System

DSS incorporate modeling or analysis tools along with database management systems and user interface which provide access and allows decision makers to combine personal judgment with computer output, in a user-machine interface, to produce meaningful information for support in a decision-making process.

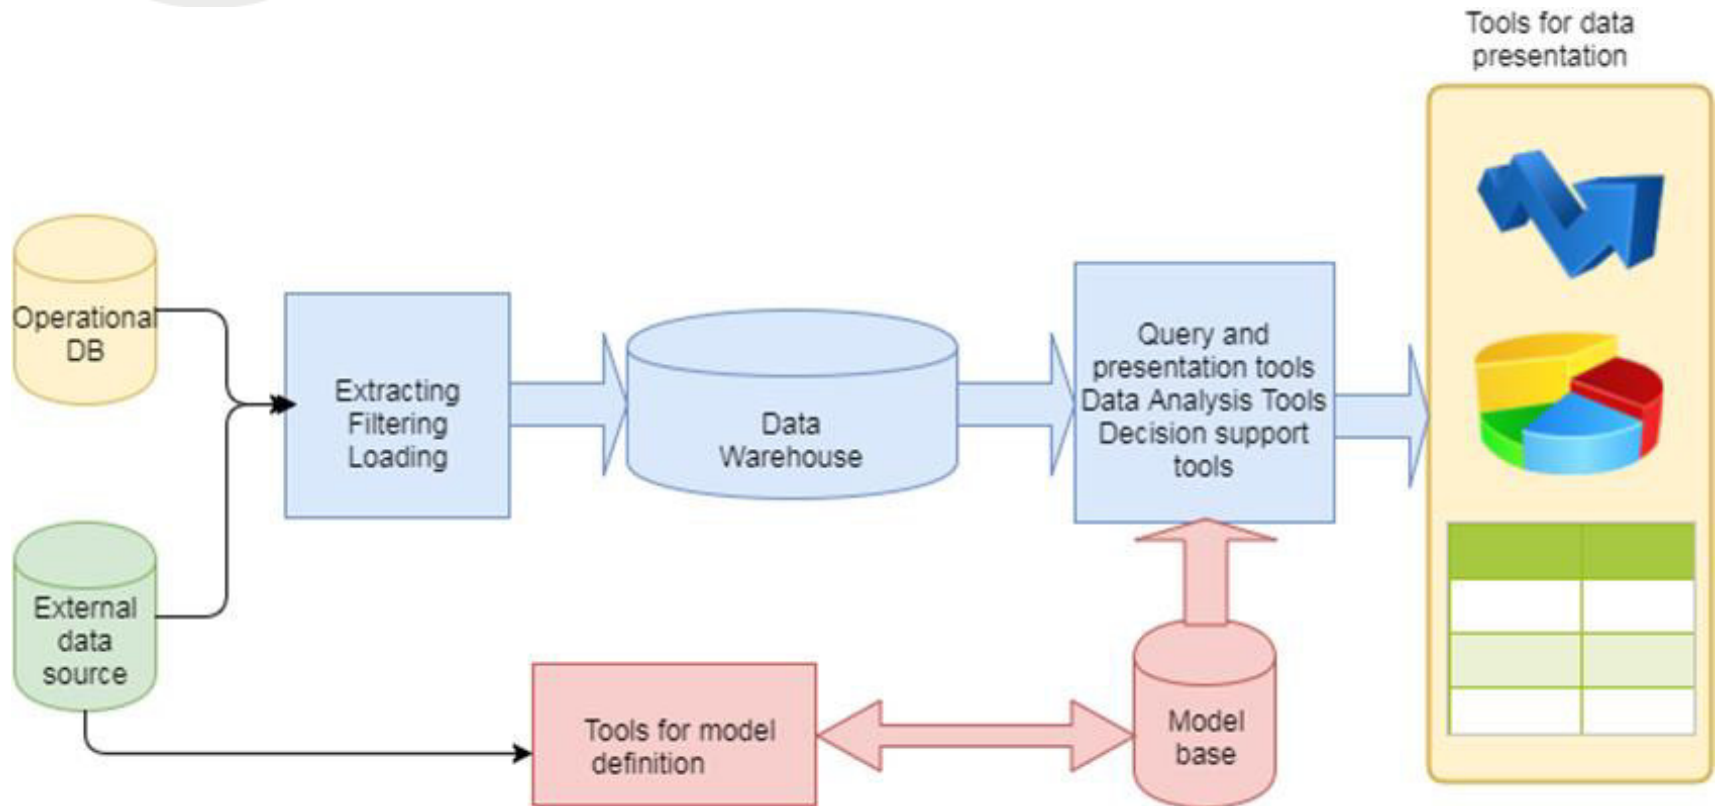

- ✓ Information-based

Data Mart

Data mining

Data mining is the analysis of (often large) observational data sets to find:

- ✓ unsuspected relationships and characteristics, dependencies,
- ✓ tendencies and summarize the data in novel ways that are both understandable and useful to the data owner.

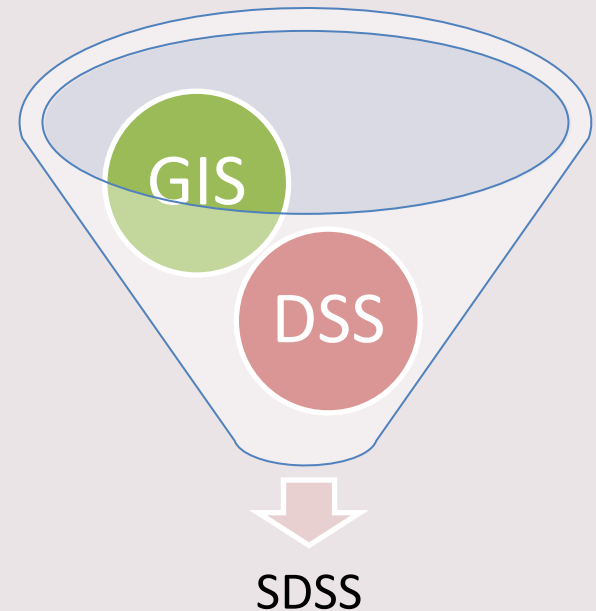

Co-funded by the
Erasmus+ Programme
of the European Union

Spatial Decision Support System

SDSS are explicitly designed to provide the user with a decision-making environment that enables the analysis of geographical and non spatial information to be carried out in the flexible manner.

Co-funded by the
Erasmus+ Programme
of the European Union

Geographic Information System

A geographic information system (GIS) is a computer system for capturing, storing, querying, analyzing, and displaying geospatial data

Co-funded by the
Erasmus+ Programme
of the European Union

Multi-criteria decision analysis (MCDA)

Forest fire risk assessment

Forest fire risk assessment

- ✓ **Defining of aim/problem**
- ✓ **Identify alternatives**
- ✓ **Identification of criteria**

Klaster	Criteria
Land use	<i>Vegetation</i>
Topography	<i>Aspect</i>
	<i>Slope</i>
	<i>Elevation</i>
Climate	<i>Mean annual air temperature</i>
	<i>Mean annual precipitation</i>
Socioeconomic	<i>Distance from settlements</i>
	<i>Distance from roads</i>

Forest fire risk assessment

Description criteria

Vegetation. The main factor that affects the spread of a forest fire is the type and the characteristics of the vegetation. The Vegetation is crucial for the fire spreading because it represents the total fuel available for the fire.

Aspect. Generally, in the north hemisphere, south and southeast aspects are the most suitable for both, ignition and spreading of fire, they receive more direct sunlight and because of that they have a higher temperature and a minor humidity.

Slope. The slope influences on the fire behavior. Steep slope can increase the rate of the fire spread. Slope affects speed and capability of firefighter and equipment movement and there for speed of fire extinguishing. increasing of the slope for 10% can double the rate of the fire spreading.

Elevation. Elevation is a crucial physiographic variable that is associated with wind behavior and fire spreading. Therefore it affects a structure of vegetation, total fuel available for fire, air humidity and temperature.

Mean annual air temperature. Air temperature is one of the most important climate factors. Fires can occur at any temperature, but their number depends on increasing of the temperature.

Mean annual precipitation. Precipitation is an important factor which influences suitability for ignition and fire spreading. It's appears in the form of air humidity, humidity of habitat and fuel. If fuel is dry, fire will spread faster.

Distance from roads. 95% of forest fires in the Mediterranean is caused by the human negligence. The roads are a significant factor because their presence means human activity, therefore the forest near roads have a higher risk of forest fires.

Distance from settlements. It was found that the man is the main cause of the fire, so it was logical that with increasing of distance from human's residence the number of fires would decrease.

AHP

Forest fire risk assessment

Goal

Assess the Riskiness of Forest Fire

Table 1 – Scale of relative importance (according to Saaty (1977; 1980)).

Intensity of importance	Definition
1	Equal importance
2	Weak
3	Moderate importance
4	Moderate plus
5	Strong importance
6	Strong plus
7	Very strong or demonstrated importance
8	Very, very strong
9	Extreme importance

AHP

Forest fire risk assessment

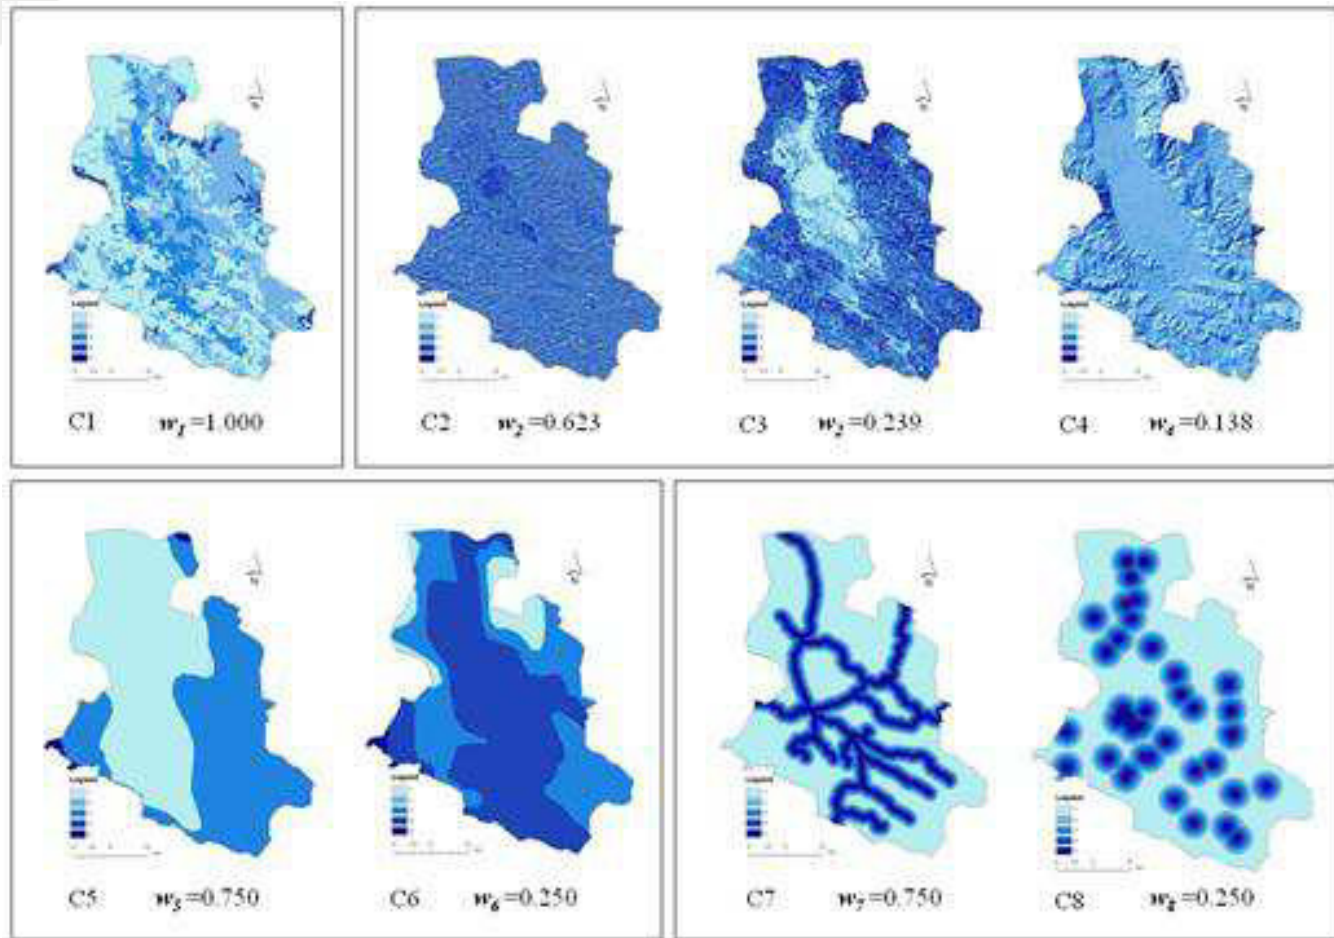

Criteria	C2	C3	C4	w_i
Aspect (C2)	1	3	4	0,623
Slope (C3)	1/3	1	2	0,239
Elevation (C4)	1/4	1/2	1	0,138
$\lambda_{\max}=3,026$ CI= 0,013 CR= 0,022				

Weighted Linear Combination

Criteria	Intensity of importance				
	1	2	3	4	5
	very low	low	moderate	high	very high
C1*	(512)	(112,332,333)	(211,242,243)	(222,231,321,324)	(311,312,313)
C2	N	NE, NW	E, W	Flat, SE	S, SW
C3	0-5°	5-15°	15-25°	25-35°	>35°
C4	>800 m	600-800 m	400-600 m	200-400 m	0-200 m
C5	< 10 C°	10-15 C°	15-20 C°	20-25 C°	>25 C°
C6	>1750 mm	1500-1750 mm	1250-1500 mm	1000-1250 mm	< 1000 mm
C7	>1200 m	900-1200 m	600-900 m	300-600 m	0-300 m
C8	>2000 m	1500-2000 m	1000-1500 m	500-1000 m	0-500 m

GIS

Forest fire risk assessment

WLC

Forest fire risk assessment

Weighted Linear Combination

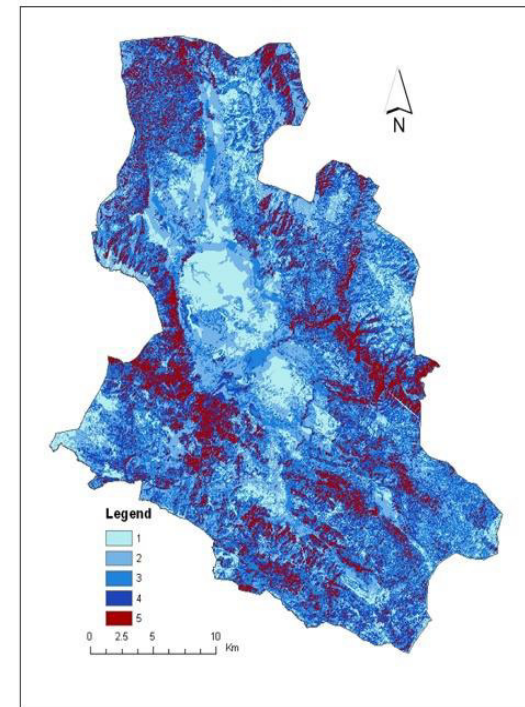

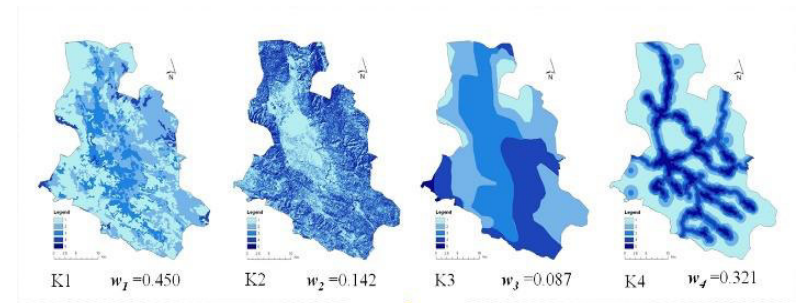

$$S = \sum w_i \times X_i,$$

where S is the fire hazard rating, w_i is normalized weight of factor i , and x_i is the criterion score of factor i .

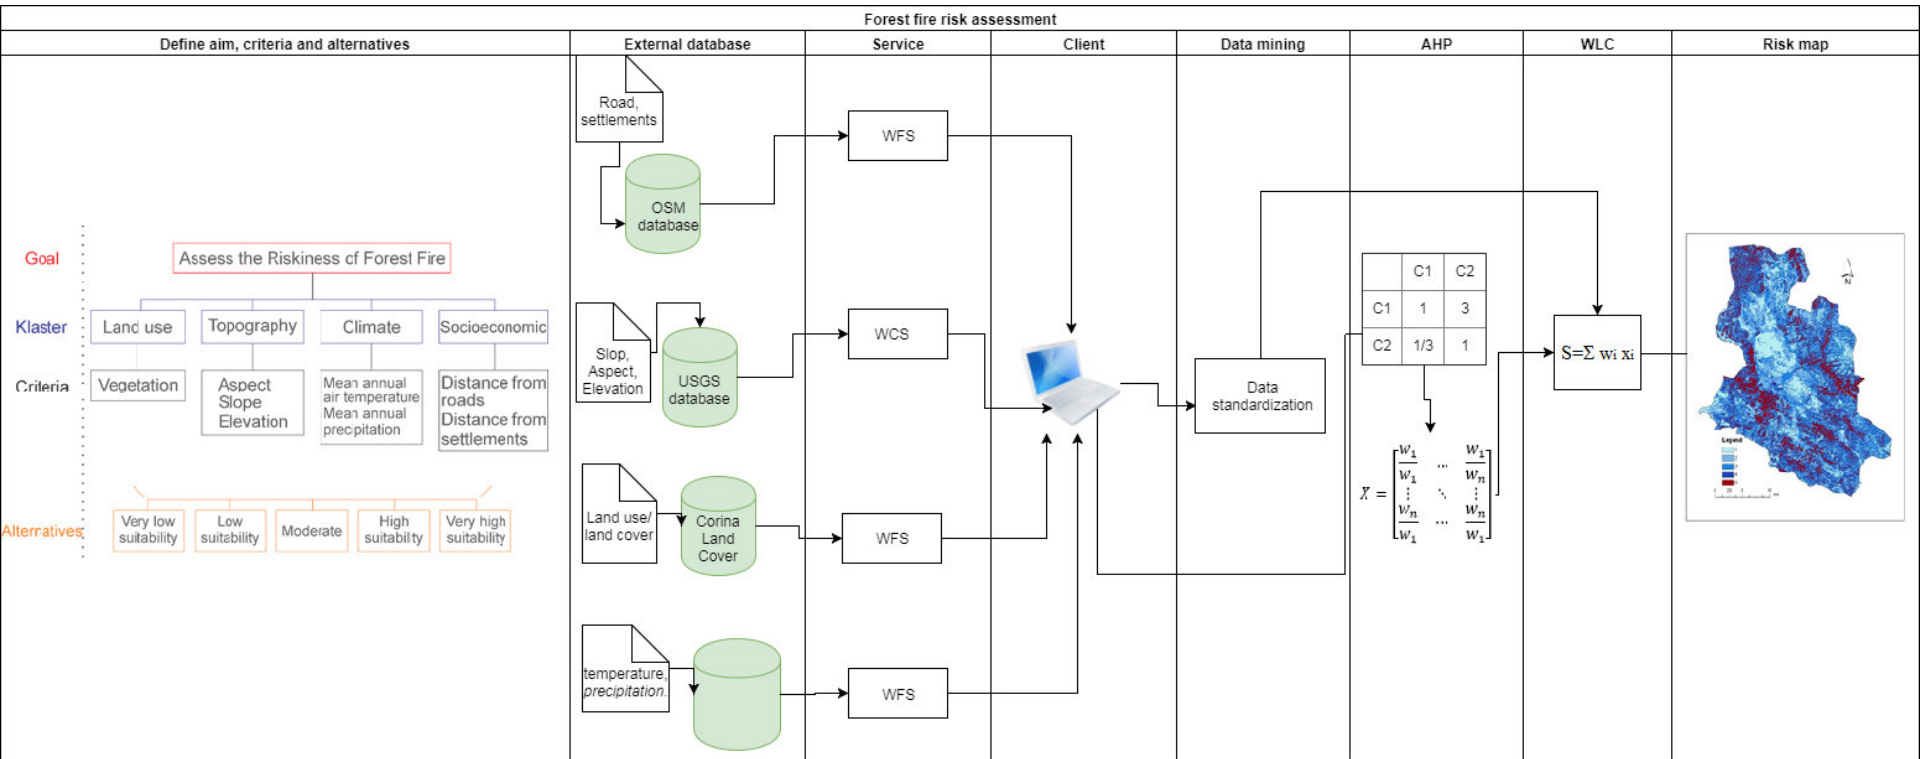

GIS

Forest fire risk assessment

	Classes	Area (km ²)	%	Number of cells (25x25)
1	Very low suitability	47,2	5,1	75.505
2	Low suitability	197,0	21,3	315.233
3	Moderate	287,6	31,1	460.149
4	High	270,2	29,3	432.357
5	Very high	121,4	13,2	194.196

Application of Service Oriented Geographic Information System in Risk Assessment

Conclusion

What are the main components of Disaster Risk Management?

What are a basic phase of Decision Making Process?

What is DSS and why we need it?

What is the major difference between DSS and SDSS?

Which data models use GIS for computer representation of real world?

What are the major advantages of SO GIS comparing to traditional GIS?

What is basic principles of Analitic Hierarchy Process?

Why we need risk map?
